

TAC values for 2011/12 season for four candidate OMPs for the West Coast rock lobster resource

S.J. Johnston and D.S. Butterworth.

Table 1: The TAC values (all MT) for the 2011/12 season associated with the various candidate OMPs. The first column reports the 2010/11 season values.

	2010 season	2011 season $\alpha=2400$ “1.40 tuning”	2011 season $\alpha=3000$ “1.30 tuning”	2011 season $\alpha=3500$ “1.21 tuning”	2011 season $\alpha=3000$ “1.30 tuning” Current sector split
Global T	2286.20	2287.54 (+0.06%)	2430.51 (+6.31%)	2514.57 (+10.0%)	2430.56 (+6.31%)
Global A1+2	37.67	36.13	36.13	36.13	33.20
Global A3+4	208.26	215.11	222.62	227.04	210.22
Global A5+6	125.93	136.93	136.93	136.93	116.59
Global A7	394.27	315.93	348.82	368.93	372.32
Global A8+	1720.09	1583.44	1686.01	1746.32	1698.21
Offshore T	1528.22	1402.40 (-8.2%)	1545.38 (-0.01%)	1629.44 (+6.6%)	1658.22 (+8.5%)
Offshore A1+2	0	0	0	0	0
Offshore A3+4	51.9	67.71	75.23	79.65	81.16
Offshore A5+6	0	20	20	20	20
Offshore A7	383.99	308.61	341.50	360.84	367.46
Offshore A8+	1092.33	1006.08	1108.65	1168.96	1189.60
Nearshore T	451	451	451	451	451
Nearshore A1+2	24.17	24.17	24.17	24.17	24.17
Nearshore A3+4	72.48	72.48	72.48	72.48	72.48
Nearshore A5+6	32.2	32.2	32.2	32.2	32.2
Nearshore A7	0	0	0	0	0
Nearshore A8+	322.15	322.15	322.15	322.15	322.15
Subsistence T	200*	251	251	251	200
Subsistence A1+2	6.6	8.30	8.30	8.30	6.60
Subsistence A3+4	41.4	52.06	52.06	52.06	41.4
Subsistence A5+6	49.2	61.86	61.86	61.86	49.2
Subsistence A7	0	0	0	0	0
Subsistence A8+	102.6107	129.00	129.00	129.00	102.6
Recreational T	107	183	183	183	121.54

*This was the allocation made, not the actual catch estimated to have been taken (which is ~270 MT)

Details of the OMP calculations

The input data are reported in Tables 2a-e. These data were reported in Glazer 2011a,b,c,d and OLRAC (2011).

The resultant resource indices calculated in the OMP using the data in Tables 2a-e are as follows:

$\bar{J}_{2011} = 1.153$ (this is the super-area and gear combined index of current abundance relative to the 2005-2009 average).

$J_{2011}^{trap} = 1.073$ (this is the trap gear index averaged over super-areas where data are available)

$J_{2011}^{hoop} = 1.215$ (this is the hoop gear index averaged over super-areas where data are available)

$J_{2011}^{FIMS} = 1.224$ (this is the FIMS index averaged over super-areas where data are available)

$J_{A1+2,2011} = 0.956$ (this is the gear-combined index of abundance for super-area A1+2)

$J_{A3+4,2011} = 1.917$ (this is the gear-combined index of abundance for super-area A3+4)

$J_{A5+6,2011} = 1.421$ (this is the gear-combined index of abundance for super-area A5+6)

$J_{A7,2011} = 0.885$ (this is the gear-combined index of abundance for super-area A7)

$J_{A8+,2011} = 0.753$ (this is the gear-combined index of abundance for super-area A8+)

The five indices above are what are used to determine if Exceptional Circumstance (EC) should be invoked for any one of the super-areas due to very poor resource performance.

The values of X_{crit}^{area} below which EC would be declared for that super-area are:

$X_{crit}^{A1+2} = 0.7$

$X_{crit}^{A3+4} = 0.85$

$X_{crit}^{A5+6} = 0.7$

$X_{crit}^{A7} = 0.8$

$X_{crit}^{A8+} = 0.7$

Thus no EC are invoked for season 2011/12.
